

Task 1 – Web App QA & Debug Report

Candidate: Lokesh Kumar

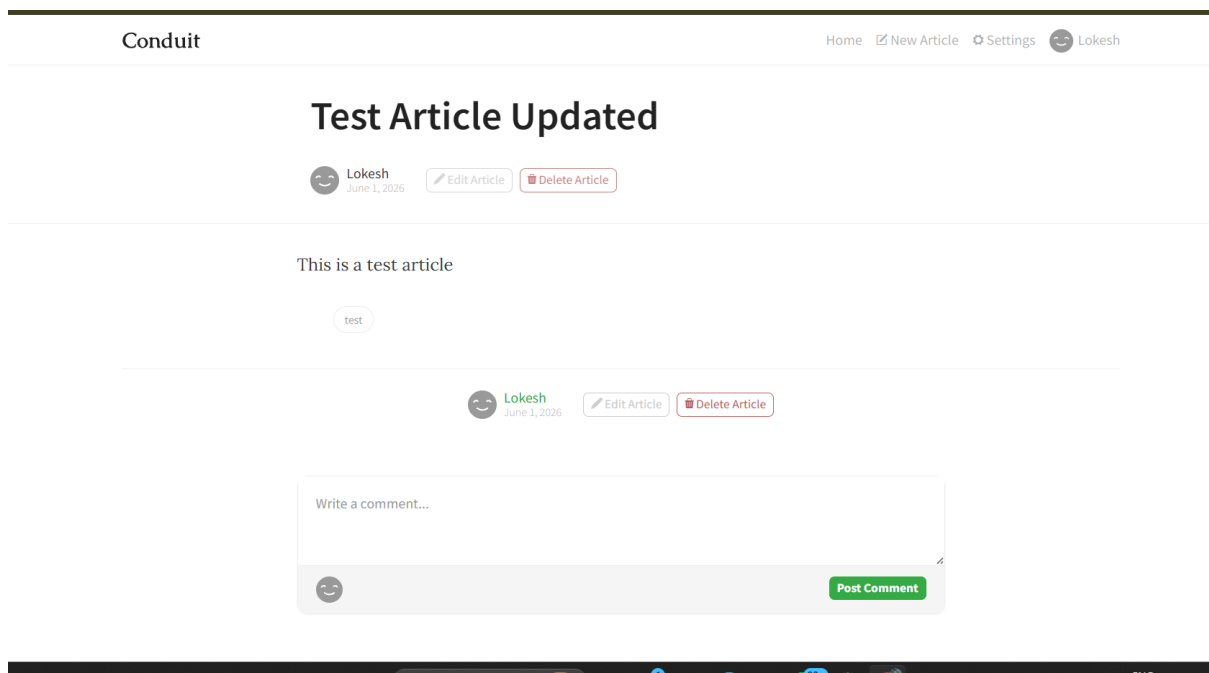

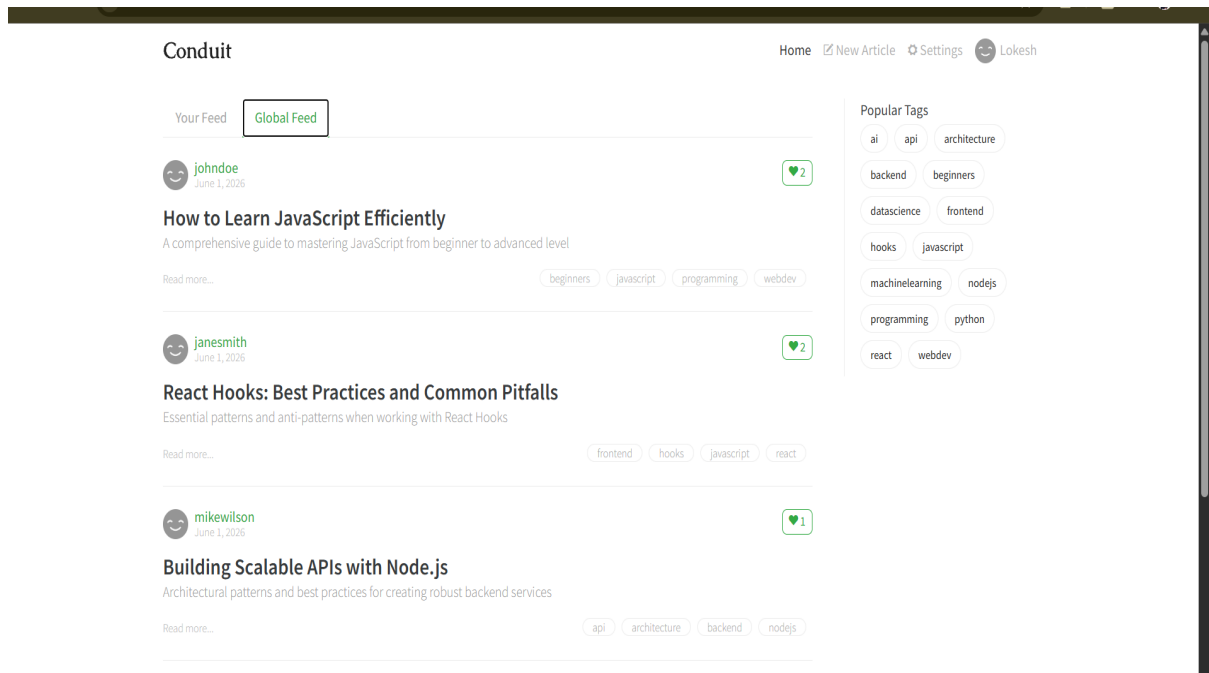

Application Tested: Conduit (RealWorld Demo)

URL: <https://demo.realworld.show>

#	Title / Summary	Severity
1	Article deletion without confirmation	Medium
2	Raw technical error exposed ('body can't be blank')	Low
3	No password strength indicator during signup	Medium
4	No email verification after registration	Medium
5	Invalid email and profile image URL accepted	High

Root Cause Analysis – Invalid Email & Profile Image URL Accepted

The application accepts invalid values such as 'abc' for email and 'hello' for the profile image URL. When the user updates settings, the form is saved successfully instead of validating the input. This indicates missing validation either on the frontend, backend, or both. An invalid image URL results in a broken profile image being displayed on the profile page. This can negatively impact user experience and data quality. The fix would be to validate email format and URL format before saving settings and return user-friendly validation messages.
